

## The Universal Blowers from Herbold Meckesheim!

The blowers are welded steel constructions, no cast iron parts (except the motor) and as a general rule they can be hinged open for cleansing and maintenance.

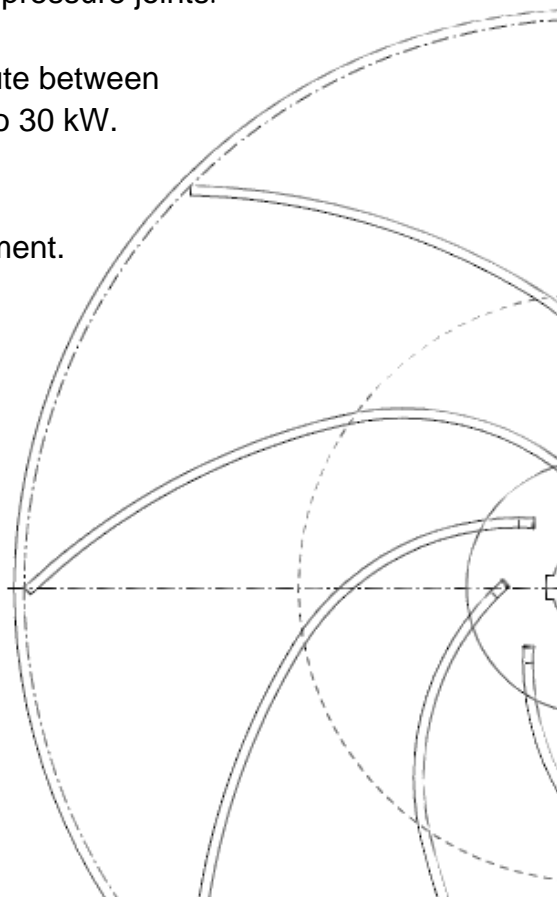

- **MFT** – blower with direct drive
- **RMFT** – belt driven, also available in a stainless steel execution for high temperatures and humid applications

For the impeller of the material blower Herbold Meckesheim uses curved vanes reducing wear and tear and avoiding an undesired further size-reduction of the materials in the blower. The blowers are also available with exchangeable antiwear inserts.

Both blower series have exchangeable antiwear inserts as well as exchangeable suction nozzles and pressure joints.

Available for air quantities per minute between 8 and 100 m<sup>3</sup> and drives from 1.5 to 30 kW.
